

This table is data collected from participants who participated in the [Zhou et al.](#) study. Each of the following markers were collected once at the start of the study.

SubjectID	Unique identification of each of the 101 participants in the study.
FPG_Mean	Mean fasting plasma glucose across several timepoints.
FPG_class	A categorical variable indicating the class/category of fasting plasma glucose levels—possibly “normal”, “impaired”, or “diabetic” ranges.
IRIS	If the subject is Insulin Resistant (IR), Insulin Sensative (IS) or Unknown.
SSPG	Steady-State Plasma Glucose level—a more specific test of insulin resistance.
FPG	Fasting Plasma Glucose level at baseline or a single measurement.
SSPG.Date	The date on which the SSPG test was conducted.
Class	A composite classification based on glucose and insulin measures, possibly distinguishing metabolic phenotypes.
Gender	Gender of the subject
Ethnicity	Ethnicity of the subject
Adj.age	Average age over the duration of the study.
BMI	BMI of the subject
OGTT	Oral Glucose Tolerance Test result, measuring glucose levels after ingestion of glucose.
OGTT_Class	Classification based on OGTT—likely categories like “Normal”, “Impaired Glucose Tolerance”, “Diabetic”.
Longitudinal.HbA1C.Group	Grouping based on longitudinal trends in HbA1C (glycated hemoglobin), which reflects average blood glucose over the past ~3 months.
A1C_Class	Classification of HbA1C levels—likely thresholds indicating “Normal”, “Pre-diabetic”, or “Diabetic”.
